## **PDF**

Building on the introductory course, *Practicing Statistics: Guided Investigations for the Second Course* presents a variety of compelling topics for a second course in statistics, such as multiple regression, nonparametric methods, and survival analysis. Every topic is introduced in the context of a real-world research question, asking students to explore the concepts firsthand with guided activities and research projects.

The number of students taking AP Statistics continues to rise, and the number of students taking an introductory statistics course has more than doubled since 1990. As a result, the goals of the second course have changed. This course must engage students from multiple disciplines and demonstrate the broad applicability of statistics to their lives. To that end, this text takes an inquiry-based approach that teaches advanced statistical techniques through group work and hands-on exploration using real research questions.

The chapters are modular, so that instructors can select only the topics relevant to their course, and teach them in any order. The only prerequisite is an algebra-based introductory statistics or AP statistics course.

Great Modern Intermediate Stats Course Book With Great Resources

By Jill F. Lundell

I have been using this book for 3 semesters in my intermediate statistics class and I have really liked it. The presentation of the material is project based and covers many current topics. The authors have not made the book tied to a specific software package and have provided software guides online for free for R and Minitab. I have found this very helpful since I am teaching the class with R.

My CD also stuck to the packaging and was destroyed when I tried to remove it. However, all of the CD materials are available online for free so it was not a problem. My students like they they can download the materials so that they didn't have to open up the CD in case.
